COVERX COVER PLATES

Reliable protection for cables laid in the ground

Polyethylene (PE) cover plates provide mechanical protection for cables placed in the ground. The plates have both warning and identification purposes (color, print). To cover straight routes without curves, they are available in coils, which enable faster and more efficient installation. We produce cover plates in various color variants with the desired print.

Each cover plate and disk is equipped with a lock for a firm longitudinal connection. This connection makes it possible to cover even slight turns. The lock is designed to withstand the harsh environment of the excavation and not to disconnect during handling.

- l continuous and fully identifiable cable protection
- l easy laying
- l usability in extremely low temperatures
- l made from 100% recycled material
- l environmentally friendly
- l long service life
- l full recyclability
