HARDEX®

XPP OPTIMA

SPUR HARDEX XPP OPTIMA is a thermoplastic structured foam made of polypropylene (PP). The structure of the foam is made up of 95-98 % closed cells. It offers excellent mechanical properties in shear and compression, impact strength, and is resistant to fatigue stress. It also offers excellent chemical resistance, water resistance, organic solvents resistance and health safety. It can be produced with higher resistance to burning and emits significantly lower toxic fumes when burning compared to other materials. It can be produced with higher resistance to UV radiation. It can be produced with recycled content and is recyclable.

Compared to materials made from foamed PET or PS, **SPUR HARDEX XPP OPTIMA** offers better mechanical properties.

SPUR HARDEX XPP OPTIMA can be used as a core for a composite sandwich structure with excellent mechanical properties combined with low weight. It is used in areas where the lightness and mechanical resistance of the product is required, e.g.: furniture boards, structural boards/profiles, the construction industry, the automotive industry – interior equipment (caravans, trucks, ...). It can be processed and cut similarly to wooden materials and can be joined with screws, nails, and glues, by fusion welding and hot air welding. The material can be processed by thermoforming. Also, the material can be laminated with functional surface layers by reactive or hot-melt glues, or in case of good compatibility without glues by heat only.
